

HOLMAN ENGINEERING

Fork Lift Controller

Holman Engineering have designed (and now manufacture) a Fork Lift Controller. This device is used on hire forklifts to monitor and control usage of the forklift.

The Forklift Controller allows the user to log onto the machine, which denies access unless a valid user code is entered, logs the start time, finish time, and keeps track of engine hours. The unit stores all information in battery backed up memory for download to a PC.

Holman Engineering has designed the Forklift Controller as a generic Controller.
